

Caution: This is an electrically powered device that you will be mounting in your incubator yourself. The thermostat is NOT electrically insulated and as with any thermostat like this, must be mounted in a protected area or shielded so that it can not be touched when there is power to the unit. Failure to do so can result in electrical shock which can result in injury or death. You must use a great deal of common sense when dealing with electrical devices. Electricity is wonderful but can be very dangerous. Use caution, common sense and if in doubt, ASK AN EXPERT!!!

This wiring diagram is the most common for incubators. The fan will always be on and the heater will turn on and off based on the set point of the thermostat.

This wiring diagram is an option for those who would like the fan to turn off when the heater turns off.
